Robustness −− In−sample predictability across subsamples

Subsample	Months	rx ~ CF : R2	rx ~ CF : t	rx ~ GCF : R2	rx ~ GCF : t	rx_USD ~ GCF : R2	rx_USD ~ GCF : t	rx_USD ~ FXGCF : R2	rx_USD ~ FXGCF : t
Full sample	412	0.250	17.16	0.252	14.25	0.081	6.28	0.096	6.80
Pre−crisis (..2007:06)	210	0.240	10.16	0.167	10.12	0.116	4.61	0.183	6.22
Financial crisis (2007−09)	30	0.174	1.66	0.052	1.76	0.052	1.58	0.047	1.44
Euro crisis (2010−12)	36	0.501	6.67	0.385	2.36	0.260	1.49	0.263	1.41
Post−crisis (2013−)	136	0.142	6.98	0.251	12.52	0.034	−2.20	0.039	−2.84

Each cell pair reports the cross−country mean single−factor in−sample R2 and the pooled fixed−effects Newey−West HAC t on the factor, estimated on the indicated subsample (dated by forecast−origin month). rx = local−currency, rx_USD = US−dollar maturity−averaged 1y excess return. CF/GCF are the local and global cycle factors; FXGCF the FX−adjusted global factor. 'Months' is the number of forecast origins in the window. Crisis windows are short, so HAC t−stats there are necessarily noisier than in the full sample.
