Robustness −− In−sample predictability across subsamples

Subsample	Months	rx ~ CF : R2	rx ~ CF : t	rx ~ GCF : R2	rx ~ GCF : t	rx_USD ~ GCF : R2	rx_USD ~ GCF : t	rx_USD ~ FXGCF : R2	rx_USD ~ FXGCF : t
Full sample	412	0.254	17.09	0.254	13.61	0.086	6.63	0.143	8.05
Pre−crisis (..2007:06)	210	0.238	10.24	0.164	9.93	0.121	4.79	0.291	7.67
Financial crisis (2007−09)	30	0.175	1.70	0.054	1.91	0.051	1.53	0.118	−2.46
Euro crisis (2010−12)	36	0.506	6.75	0.387	2.41	0.258	1.45	0.265	0.68
Post−crisis (2013−)	136	0.133	6.68	0.242	11.51	0.040	−1.64	0.041	−2.08

Each cell pair reports the cross−country mean single−factor in−sample R2 and the pooled fixed−effects Newey−West HAC t on the factor, estimated on the indicated subsample (dated by forecast−origin month). rx = local−currency, rx_USD = US−dollar maturity−averaged 1y excess return. CF/GCF are the local and global cycle factors; FXGCF the dollar−return global factor. 'Months' is the number of forecast origins in the window. Crisis windows are short, so HAC t−stats there are necessarily noisier than in the full sample.
