Robustness −− In−sample predictability across subsamples

Subsample	Months	rx ~ CF : R2	rx ~ CF : t	rx ~ GCF : R2	rx ~ GCF : t	rx_USD ~ GCF : R2	rx_USD ~ GCF : t	rx_USD ~ FXGCF : R2	rx_USD ~ FXGCF : t
Full sample	412	0.247	17.03	0.247	14.26	0.080	6.20	0.095	6.74
Pre−crisis (..2007:06)	210	0.237	10.21	0.164	9.92	0.120	4.72	0.187	6.29
Financial crisis (2007−09)	30	0.176	1.70	0.054	1.89	0.051	1.54	0.047	1.44
Euro crisis (2010−12)	36	0.506	6.75	0.386	2.41	0.258	1.45	0.262	1.37
Post−crisis (2013−)	136	0.133	6.62	0.234	12.02	0.035	−2.53	0.041	−3.14

Each cell pair reports the cross−country mean single−factor in−sample R2 and the pooled fixed−effects Newey−West HAC t on the factor, estimated on the indicated subsample (dated by forecast−origin month). rx = local−currency, rx_USD = US−dollar maturity−averaged 1y excess return. CF/GCF are the local and global cycle factors; FXGCF the FX−adjusted global factor. 'Months' is the number of forecast origins in the window. Crisis windows are short, so HAC t−stats there are necessarily noisier than in the full sample.
