

Robustness -- Out-of-sample estimation scheme: window shape and training length

Specification	Expanding, 5y min (baseline)	Expanding, 3y min	Expanding, 7y min	Rolling 10y window	Rolling 15y window
rx ~ CF	-0.073	-0.120	-0.002	-0.219	-0.119
rx ~ GCF	0.048	0.051	0.048	-0.103	-0.038
rx_USD ~ GCF	-0.070	-0.097	-0.009	-0.043	-0.061
rx_USD ~ FXGCF	0.021	-0.124	-0.102	-0.073	0.013

Pooled Campbell–Thompson R2_oos of the fully–recursive factor against the recursive prevailing mean, with the entire factor chain (cycle decomposition, predictive regression, benchmark) rebuilt under each scheme. 'Expanding' uses all history up to t with a 3–/5–/7–year training minimum; 'Rolling' uses only the most recent 10/15 years. Each scheme scores its factor against the mean built under the same scheme, so columns are internally consistent. The expanding/5–year column reproduces the oos.R baseline (Table 8.2). The global cycle factor's edge is invariant to the training–minimum length but is specific to the expanding window.
