v = 0.995, M = 180	412	0.92	0.90	0.94	0.245	0.243	14.16	-0.040	0.041

Trend inflation rebuilt from the same core CPI under every combination of decay v in {0.900, 0.987, 0.995} and window M in {60, 120, 180} months (baseline v = 0.987, M = 120), then pushed through the full factor chain. 'corr trend'/'corr CF' are mean per-country correlations with the baseline on the common sample; 'corr GCF' is the global-factor correlation. 'R2 CF'/'R2 GCF' are cross-country mean in-sample fits of rx on the variant factor, 't GCF' the pooled fixed-effects HAC t. 'OOS R2' is the pooled Campbell-Thompson R2 of the fully-recursive variant chain (expanding, 5y minimum). The core-CPI history begins early enough that every variant's trend predates the yield sample, so all cells share the same forecast-origin months.
