

Robustness -- Out-of-sample R²_oos across subsamples

Subsample	rx ~ CF	rx ~ GCF	rx_USD ~ GCF	rx_USD ~ FXGCF
Full sample	−0.076	0.046	−0.071	0.019
Pre-crisis (..2007:06)	−0.228	0.087	0.125	−0.024
Financial crisis (2007–09)	−0.395	−0.187	−0.177	0.077
Euro crisis (2010–12)	0.050	0.014	−0.079	0.002
Post-crisis (2013–)	−0.088	0.089	−0.038	0.003

Pooled Campbell–Thompson (2008) out-of-sample R² of the fully-recursive factor forecast against the recursive prevailing mean, scored over country-months whose forecast-origin lies in the window (squared errors aggregated across the G10). Positive = the factor beats the real-time historical average. Both the factor and the predictive regression respect time *t* (doubly out-of-sample). All four factors share a five-year training minimum, so every window carries real-time forecasts. Factors as in Table 8.1.
