

CP 2015 Table 4. Predicting individual returns with the cycle factor

Statistic	rx(2)	rx(5)	rx(10)
cf	0.70	1.47	1.51
(t-stat)	(2.02)	(3.43)	(4.32)
SS [5%,95%]	[0.32,6.84]	[1.79,8.38]	[2.90,8.86]
R2_bar	0.09	0.23	0.29
Delta R2	0.31	0.24	0.25
B1: c(1) (t)	-0.66 (-1.70)	-0.66 (-3.24)	-0.40 (-4.07)
B1: c(n) (t)	0.78 (1.91)	1.10 (3.50)	1.11 (4.95)
R2_bar	0.06	0.22	0.40
B2: c(n) (t)	0.06 (0.76)	0.16 (1.08)	0.42 (2.19)
R2_bar	0.02	0.03	0.14

LHS: duration-standardized individual excess return $rx^i(n)$. US, 264 obs. Panel A regresses on cf; B1 on $c^i(1)+c^i(n)$; B2 on $c^i(n)$.
t-stats Newey-West HAC (18 lags). SS = stationary block bootstrap of the cf t-stat (mean block 12, R=5000).
